REASON FOR ALLOWANCE

1. Odell discloses an attachment section wheel spinner comprising a front portion, a flange extending outwardly from said front portion in a substantially perpendicular manner, at least one bearing rotatably coupled to said flange in a substantially parallel manner such that said at least one bearing defines a roll support surface substantially perpendicular to said front portion, and a back portion adapted to couple to a wheel, said back portion opposing said front portion, wherein said back portion and said front portion define a plurality of bolt holes. Whiteman, McCaster, and Clifford et al disclose various types of internal spinner for a wheel comprising an annular attachment section coupled to the wheel, an annular spinning section rotatably coupled to the attachment section, a plurality of bearings coupling the annular attachment section to the annular spinning section. However, none of the references of record suggests an attachment section for an internal spinning system wherein a plurality of ports for supporting a plurality of roll pins on which said at least one bearing is adapted to roll is provided in the manner defined in the instant claim 1 and in combination with other limitations of the claim. Also, None of the references of record suggests an internal spinning system for a wheel including a rotor and a rim comprising an annular attachment section, wherein a flange extending outwardly from the first portion and away from the rotor, said first front portion and said first back portion define an opening receiving at least a portion of the wheel, wherein a common external edge between a second front portion and a second back portion comprises an ornamental spinning portion, wherein said annular spinning section rotates as a function of said plurality of bearings in the manner defined in the

instant claim 9 and in combination with other limitations of the claim. Therefore, claims 2, 4-5, 11-20, depending therefrom are considered to be allowable.
